

# American Airlines Coding Exercise

Please begin by creating a new iOS application project in Xcode. The purpose of this application is to allow the user to manage a list of tasks. The application should have the following functionality:

- View a list of tasks
- Add a new task
- Toggle task completion
- Delete a task

Please use SwiftUI and MVVM for your architectural pattern. You may use internet resources and documentation as needed but no AI or Agentic coding.

If time permits, please do any of the following:

- Persist the data using UserDefaults or @AppStorage
- Add unit tests for your model and view model.
- Add the ability to edit tasks
- Add the ability to re-order tasks
